

Lesson 6

“Computational art critics”

Starter

- To think about: why do we plan code before we write it?

Today

- Get into teams of 3-4 people

Discuss in your groups

- Which of the following 3 descriptions matches the program on your table...

Option 1

The program first asks the user to specify a colour. A circle is then drawn in this colour. After that, the pen is up so no line is drawn. The turtle moves 100 steps to the right. The program then asks the user to specify another colour. Another circle, the same size as the first, is drawn in the new colour.

Option 2

The program first asks the user to specify a colour. A circle is then drawn in this colour. After that, the pen is up so no line is drawn. The turtle moves 100 steps to the right. The program then draws another circle, the same size as the first, in the same colour.

Option 3

The program first asks the user to specify a colour. A circle is then drawn in this colour. After that, the pen is up so no line is drawn. The turtle moves 100 steps to the right. The program then draws another circle, a different size, in the same colour as the first circle.

Planning – 15 minutes

- Spend 15 minutes making a plan in your teams for what you are going to create
- Draw on paper what your art is going to look like
- You should also write down what Python commands you think are going to be useful
- Show me your plans before you start coding!

Coding – 30 minutes

- You have 30 minutes to work in your teams to create your piece of art
- Use your cheatsheets to help!

Code review

- Copy and paste your code into a Word document

Code review – 30 minutes

- Copy and paste your code into a Word document
- Move round to another team's table. First, look at their code and make a prediction of what you think the art is going to look like. Then, run it on the code editor and see if you were correct.
- Then, fill out your review sheets.

Closing

- Thank you all for taking part in these lessons! I'll be back in 2 weeks to do your last set of assessments.
